Comments	
I could understand all the suggestions, but the clearest suggestions kept to the language syntax.	
Some of the buggy code issues seems can be identified by the static typed languages easily, I guess the target usage for this method is for dynamic typed languages, e.g. JS and Python ?	
some of the patches appeared to be only portion of the line	
This is going to be very helpful for coders.	
The approach seems to be very helpful in reducing debug time	
Sometimes the machine learning solution is too long and it's hard to follow it. I also like ID and LIT much more than other long syntax. And I think if it wants to be a handy tool, it should be integrated to IDE such as VSCode Plugin and visualize its solution more from what it's now.
